List of functions not working correctly:

- Unable to edit the category of a resource.
    - Location of this error can be solved in the edit_resource() method.
    - Possible action for this would be to edit the method according to what is the desired functionality. Also to add a field where you can edit the category and use the update function.
- You can edit other people's resources.
    - The edit_resource function should check if the resource that is being edited is one that belongs to that person by checking the user_id.
- You can delete other people's resources.
    - The delete_resource function should check if the resource that is being deleted is one that belongs to that person by checking the user_id.
- Can add an Image value with attaching an image.
    - Location is in upload_image method.
    - We need to add empty error checking for the image in the uploadImage()
- Can upload photos on all resources in the List Resources page instead of just my resources.
    - Need to have a check if the user created the resource
    - Also have the upload photos option only when you click on a certain resource id
- Search only looks in the "resource type" and not the other fields
    - We need to add some more checking statements that would check all the fields for the searched key
    - Location is in the search_resource() method.
- Can only comment on photos and not each resource

- Link the photo to the resource in the database
- Also add the commenting form to each single resource. This can be done in the list_single_resource method
- If the image ID and the user ID match, the upload tab/comment tab would be redirected
    - Location: parameters in menu.py
- Not able to add friends or make groups
    - Never made this task/function
- Not able to use user location for nearby resources
    - Never made this task/function
